

Work principle of DeKa-Titan

Arbeitsweise des DeKa-Titan

The pain (or better: the pain information) is running from the pain source over nerves to the spinal cord and from there to the brain. Pain in the area of the head runs directly to the brain. This information gets transformed into the feeling "pain". The pain information never runs through the blood vessels, and never goes from the brain to the DeKa-Titan bracelet!

I assume the following:

The DeKa Titan bracelet has a capacitor/condenser of high capacity, which produces an electric field. This capacitive electric field is spread through the skin, tissue and – especially – through the conductive blood over the whole body. (The reason for wearing the bracelet at the left wrist is that the inner surface of the left wrist has high contact to big blood and lymph vessels.)

So the capacitive electric field also gets to the nerves that transfer the pain information to the brain and "disturbs" this pain information. As a result, the pain information is not recognized as the feeling "pain" in the brain and the patient does not feel pain any more. The cause of the pain still exists! In other words, the bracelet suggests the brain that everything is ok by disturbing/blocking/changing the pain information on its way to the brain.

So the blood does not transfer the pain to the bracelet, the bracelet transfers the capacitive electric field to the pain!

I hope I could describe the process – as I see it – in a comprehensible way. If you have any further questions, please do not hesitate to ask me at any time.

Yours sincerely,

Dr. Helmut Schaudig
